

Carbon Cycle

1. Photosynthesis-Plants use CO_2 from the atmosphere.
2. Consumption- Animals eat the plants
3. Cellular Respiration- Exhaling CO_2 (Animals and plants do this!)
4. Decomposition- Plants and animals die then decompose, so C in the soil
5. Fossil Fuels- Nutrients in soil leads to millions of years as storage until it becomes fossil fuels
6. Combustion--Fuels burn releasing C into the atmosphere.
7. Absorption- Oceans takes in C
8. Evaporation- Oceans give off C
