## CARBON BUDGET

The cycling of carbon through photosynthesis and respiration is only part of the global cycling of carbon. Geochemical processes also contribute to carbon cycling. Biological processes transfer carbon between organisms and the environment; geochemical processes transfer carbon between sedimentary rocks and the atmosphere, oceans and living organisms. Biological processes are relatively short term, occurring over years to hundreds of years while geochemical processes work on a time scale of millions of years.

Carbon occurs primarily as carbon dioxide  $(CO_2)$  in air and water, organic carbon (proteins, fats, carbohydrates, and nucleic acids) in living and dead organisms, and carbonate ions  $(CO_3^{-2})$  in water, rocks, shells, and bones. To understand how these are connected in a cycle, it is useful to think in terms of sources, sinks, and fluxes. Sources are carbon emitters (give off carbon); sinks are carbon absorbers (take in carbon); fluxes are flows of carbon between sources and sinks (how carbon moves). For carbon fluxes the bigger the number the faster the carbon moves. In addition, a source may also be a sink. For example, the atmosphere is a source of carbon dioxide for photosynthesis, but it is also a sink for carbon released during respiration, burning, and decay.

In this activity you will model the carbon reservoirs and fluxes and consider what might happen to the increasing carbon dioxide produced by human activities.

| Reservoir                 | Carbon in Gt |  |
|---------------------------|--------------|--|
| Ocean surface             | 1,000        |  |
| Ocean life                | 6            |  |
| Organic material in ocean | 1,000        |  |
| Deep ocean water          | 38,000       |  |
| Ocean sediments           | 3,000        |  |
| Sedimentary rocks         | 100,000,000  |  |
| Soil                      | 1,600        |  |
| Fossil fuels              | 4,000        |  |
| Living land organisms     | 600          |  |
| Atmosphere                | 750          |  |
|                           | •            |  |

Table 1: Carbon Reservoirs

|  | Dinacti | ion of | Movom   | ~  |
|--|---------|--------|---------|----|
|  | DIFECT  |        | INDVEIN | 21 |

Table 2: Carbon Fluxes

| Direction of Movement                | Flux (Gt/yr) |
|--------------------------------------|--------------|
| Ocean to atmosphere                  | 102          |
| Atmosphere to ocean                  | 105          |
| Ocean surface to deep waters         | 39           |
| Deep waters to ocean surface         | 37           |
| Ocean surface to ocean life          | 28           |
| Ocean life to ocean surface          | 29           |
| Soil to atmosphere                   | 60           |
| Life on land to soil                 | 60           |
| Life on land to atmosphere           | 50           |
| Atmosphere to life on land           | 110          |
| Deforestation to atmosphere          | 1.6          |
| Fossil fuel combustion to atmosphere | 5.4          |

- 1. Use the information in the table "Carbon Reservoirs" to complete the diagram of the global carbon cycle. Put the number of gigatonnes of carbon stored in each reservoir in the small boxes in each reservoir. One gigatonne (Gt) equals 1,000 million tones, and 1 tonne equals 1,000 kg.
- 2. Table 2 shows the fluxes of carbon between reservoirs, measured in gigatonnes of carbon per year (Gt/yr). Add these fluxes to the diagram of the global carbon cycle. Clearly label each line with the number and indicate the direction of flow with an arrow.

## Global Carbon Cycle

| Oceans            |           |                     |
|-------------------|-----------|---------------------|
|                   |           |                     |
| Surface<br>Waters | Organisms | Organic<br>Material |
| Deep Water        |           |                     |
| Ocean Sediments   |           |                     |

|                  |
|                  |

## Sink or Source?

Label each of the following as a SOURCE (releasing  $CO_2$ ) or a SINK (Absorbing

| <i>CO</i> <sub>2</sub> ).                        |                |  |
|--|----------------|--|
| Process  | SOURCE OR SINK |  |
| Animal Respiration                               |                |  |
| Phytoplankton Growth                             |                |  |
| Ocean Acidification (CO2<br>dissolving in ocean) |                |  |
| Plant Respiration                                |                |  |
| Fuel Combustion                                  |                |  |
| Volcanic Eruption                                |                |  |
| Rock Formation                                   |                |  |
| Rock Weathering (breaking down)                  |                |  |
| Plant Photosynthesis                             |                |  |
| Shell Formation                                  |                |  |
| Plant/Animal Decomposition                       |                |  |
